Double-Click on Macro Name to Copy It to One of Your Templates

SubLib

Description: Contains a variety of subroutines the user can call from other macros.

DoubleBackslash

Doubles backslash characters in a recently inserted field. To call subroutine, insert *SubLib.DoubleBackslash* in your macro.

DoubleCharacter

Doubles a specified character in a recently inserted field. To call subroutine, insert *SubLib.DoubleCharacter(DubChr$)* into your macro. *DubChr$* can be this variable or a value.

HandleBadWindow

Checks if you have a macro window active. If so, lists active windows so that you can activate the window where you want the macro to run. To use this subroutine, insert the following lines:

```
If SelInfo(27) Then SubLib.HandleBadWindow
If SelInfo(27) Then Goto Bye
```

The second line handles the case in which the user cancels the

dialog box that appears when SubLib.HandleBadWindow runs. Also, add a *Bye:* label at the end of the macro. The macro must be in the same template as the SubLib macro.
